

BranchFix Spreaders

Use BranchFix spreaders to form stronger, more horizontal branches and earlier fruiting of your fruit trees. Install in summer while the young branches are still pliable. Leave in place for 1 to 2 months until branch is set in position, then remove for reuse.

BranchFix 1 is for bending down young shoots on fruit trees, and is most suited for bending down a branch with an upward curve.

BranchFix 2 is placed on the main leader of the tree to hold first year or young branches at the desired angle.

BranchFix 3. If several branches leave the trunk from near the same height, one can be bent with BranchFix 2 and the other positioned with BranchFix 3 (its arm has a raised section of approx. 3/4 inch or 20 mm).
